

First Step

The image shows the interior of a metal box. A long, rectangular metal plate is inserted into the box, positioned horizontally. The plate is secured to the inner walls of the box with tape. A small rectangular opening in the center of the plate reveals a piece of brown cardboard underneath. The metal surface is dark and reflective.

Insert long plate first and tape edges

Second Step

The image shows the interior of the same metal box. In addition to the long plate from the first step, two side angle plates are now inserted. These plates are positioned vertically, meeting the long plate at the center and extending towards the side walls of the box. They are also secured with tape. The central opening still shows the cardboard. The overall structure is more complete, forming a more enclosed rectangular space.

Insert side angle plates and tape edges
